1 Summary

The example process completed 96 of 100 planned checks. The next cycle should keep the current staffing level and address the four outstanding checks. This report presents fictional operating data, the comparison method, and the next actions.

Prepared on 2026-01-15 by Example Analyst. The work mix appears in Figure 1, and the outcome measures are in Table 1.[1]

1.1 Outcome measures

Table 1 — Planned and completed checks

Measure	Planned	Completed
Initial review	40	39
Follow up review	35	33
Final review	25	24
Total	100	96

The completion fraction is $r = 96/100 = 0.96$. The numerical result is a planning indicator, not a claim about any real organization.

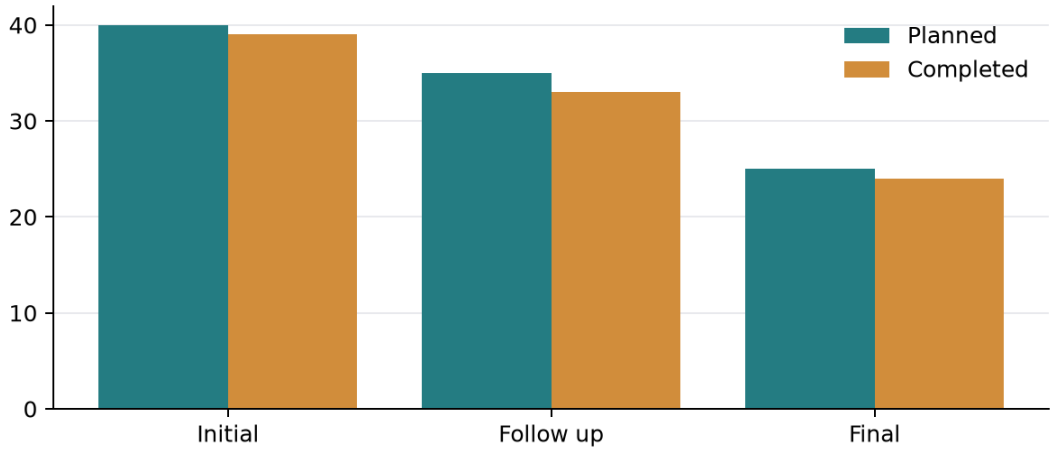

Figure 1 — Planned and completed checks

2 Method and comparison

The same counting rule applies to every group. A check counts as complete only when the example reviewer has recorded its result.

1. Counts are fictional. A completed check has a recorded result; repeated observations count once.

2.1 Capacity trend

Table 2 — Weekly capacity observations

Week	Capacity	Used
One	100	82
Two	100	89
Three	100	96

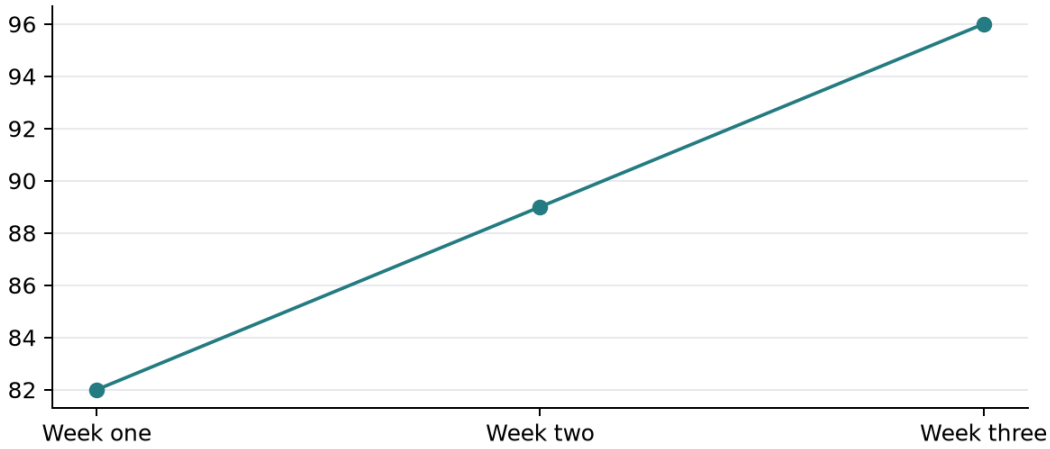

Figure 2 — Completed checks across three weeks

The arithmetic mean is defined by the following expression.

$$\bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i$$

2.1.1 Calculation example

```
completed = [82, 89, 96]
mean_completed = sum(completed) / len(completed)
assert mean_completed == 89
```

Use the same observation window when comparing one cycle with another.

3 Next actions

Table 3 — Actions for the next review

Action	Owner	Status
Recheck four open items	Example Reviewer	Planned
Confirm next review date	Example Coordinator	Planned
Archive the completed checks	Example Analyst	Complete

- ☑ Validate the current sample totals.
- ☐ Review the four remaining checks.
- ☐ Compare the next result with Figure 2.

1. Review the source table before publishing.
2. Rebuild the report after changing any data.

See 1 Summary for the decision and Table 3 for ownership.
